

## Comm-Log Send Reconciliation - Reconciliation Bridge

| Step  | Description                                    | Result | Reason                                                                                                                                                                                                                                                   |
|-------|------------------------------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Naive count of campaign communication-log rows | 30     | This is the initial population: all campaign send attempts recorded for merchant 501 during October 2026.                                                                                                                                                |
| 1     | Keep delivered sends only                      | 26     | Only successfully delivered communications qualify at the send level. Four of the 30 attempts have delivery_status = 1100 (failed), leaving 26 delivered sends.                                                                                          |
| 2     | Exclude sends from non-reportable campaigns    | 22     | A send is reportable only when its campaign has completed the required creation and processing states. Campaign 9004 is still approval_awaiting, so its four delivered sends are excluded.                                                               |
| 3     | Validate retry-family counting                 | 22     | Campaigns linked through parent_id form one underlying retry chain. Within each eligible retry family, the same customer should be counted only once. This changes the counting method but produces no additional numerical adjustment for this dataset. |
| 4     | Validate standalone-campaign counting          | 22     | Campaign 9101 has no parent or child retries, so it is a standalone communication. Each successful send is a separate event; therefore both sends to C20 are counted rather than deduplicated.                                                           |
| Final | Finance target_base                            | 22     | <b>10 + 7 + 5 = 22.</b> The retry family 9001 -> 9002 -> 9003 contributes 10 distinct customers, standalone 9101 contributes 7 send events, and retry family 9201 -> 9202 contributes 5 distinct customers.                                              |

**Independent verification:** 9001 -> 9002 -> 9003 = 10; 9101 standalone = 7; 9201 -> 9202 = 5; total = 22.
